In mathematics, graph theory is the study of graphs, which are mathematical structures used to model pairwise relations between objects. A graph in this context is made up of vertices, nodes, or points which are connected by edges, arcs, or lines. A graph may be undirected, meaning that there is no distinction between the two vertices associated with each edge, or its edges may be directed from ...

In mathematics, spectral graph theory is the study of the properties of a graph in relationship to the characteristic polynomial, eigenvalues, and eigenvectors of matrices associated with the graph, such as its adjacency matrix or Laplacian matrix. The adjacency matrix of a simple graph is a real symmetric matrix and is therefore orthogonally diagonalizable; its eigenvalues are real algebraic ...

The intension of this note is to introduce the subject of graph theory to computer science students in a thorough way. This note will cover all elementary concepts such as coloring, covering, hamiltonicity, planarity, connectivity and so on, it will also introduce the students to some advanced concepts.

Abstract Graph theory is becoming increasingly significant as it is applied to other areas of mathematics, science and technology. It is being actively used in fields as varied as biochemistry (genomics), electrical engineering (communication networks and coding theory), computer science (algorithms and computation) and operations research (scheduling).

Dust jacket notes: "Graph theory is increasingly being used to model situations arising in the applied sciences. This text, in addition to treating the basic material in some depth, includes a wide variety of applications, both to real-world problems and to other branches of mathematics.

Graph Spectrum. The set of graph eigenvalues of the adjacency matrix is called the spectrum of the graph. (But note that in physics, the eigenvalues of the Laplacian matrix of a graph are sometimes known as the graph's spectrum.) The spectrum of a graph with  $k$ -fold degenerate eigenvalues is commonly denoted (van Dam and Haemers 2003) or (Biggs 1993, p. 8; Buekenhout and Parker 1998).

2 A spatial graph is the union  $\hat{I}$  of some strings with endpoints in  $R^3$  which are mutually disjoint except the endpoints. A vertex of a spatial graph  $\hat{I}$  is a point in  $\hat{I}$  gathering more than 3 strings and an edge of  $\hat{I}$  is a connected component of the strings obtained from  $\hat{I}$  by cutting along all the vertices of  $\hat{I}$ . For example, Kinoshita's  $\hat{I}_3$ -curve in Figure 2 is a
