thorough knowledge of the external ear and tympanic membrane (TM) is essential to those involved in the diagnosis or rehabilitation of auditory disorders. Audiologists are increasingly involved in making impressions of deep portions of the external auditory canal as well as the fitting of hearing instruments near the TM.

Anatomy and Orientation of the Human External Ear

Outer ear: Acoustic energy, in the form of sound waves, passes pinna, ear canal. Sound waves hit the ear drum, causing it to vibrate like a drum. Middle ear: It sets three ossicle bones (malleus, incus, stapes) into motion, changing acoustic energy to mechanical energy. These middle ear bones mechanically amplify sound and compensate mismatched impedance.
