Ongoing research in hydrology and water resources deals with surface and ground-water processes, hydrometeorology and hydroclimatology, watershed response to disturbance, remote sensing, data assimilation, hydrologic modeling and parameter estimation, multiobjective resources planning and management, numerical modeling of solute transport in groundwater, and optimization of conjunctive use of surface water and groundwater.

IMPORTANCE OF HYDROLOGY Water is the most important resource of any country, and of the entire society as a whole, since no life is possible without water. It has this unique position among other natural resources, because the country can survive in the absence of the other resources except this one.

discussion is needed, consult a basic hydrology text that covers these concepts. Applying Hydrology Concepts Understanding surface hydrology is important when preparing a drinking water source assessment and protection (DWSAP) report or survey. Various methods are commonly used to study a watershed's hydrology.

GROUND-WATER HYDROLOGY Ground-water supplies are obtained from aquifers, which are subsurface units of rock and unconsolidated sediments capable of yielding water in usable quantities to wells and springs. The hydrologic characteristics of aquifers and natural chemistry of ground water determine the availability and suitability of ground-water resources for specific uses.

hydrology, which is fundamental for water resources management, is the accurate definition and control of the water balance for different space and time increments.

environment for hydrology and water resources, the impacts on hydrology and water resources that would result from the project, and the project design features that would reduce these impacts. This section includes a range of topics related to water resources, including surface water hydrology, water quality, groundwater, and floodplains.

hydrology. Hydrology is the science that encompasses the study of water on the Earth's surface and beneath the surface of the Earth, the occurrence and movement of water, the physical and chemical properties of water, and its relationship with the living and material components of the environment.
