

### **new polymeric materials 5th pdf**

Polymeric gas-separation membranes were commercialized 30 years ago. The interest on these systems is increasing because of the simplicity of concept and low-energy consumption. In the refinery, gas separation is needed in many processes such as natural gas treatment, carbon dioxide capture, hydrogen purification, and hydrocarbons separations.

The simplest borate anion, the orthoborate(3-) ion,  $[\text{BO}_3]^{3-}$ , is known in the solid state, for example in  $\text{Ca}_3(\text{BO}_3)_2$ . In this it adopts a near trigonal planar structure. It is a structural analogue of the carbonate anion  $[\text{CO}_3]^{2-}$ , with which it is isoelectronic. Simple bonding theories point to the trigonal planar structure.

A proton exchange membrane fuel cell transforms the chemical energy liberated during the electrochemical reaction of hydrogen and oxygen to electrical energy, as opposed to the direct combustion of hydrogen and oxygen gases to produce thermal energy.. A stream of hydrogen is delivered to the anode side of the MEA. At the anode side it is catalytically split into protons and electrons.

In FDM method, a continuous filament of a thermoplastic polymer is used to 3D print layers of materials (Fig. 1a). The filament is heated at the nozzle to reach a semi-liquid state and then extruded on the platform or on top of previously printed layers.

### **Additive manufacturing (3D printing): A review of**

FDA recently approved a 3D-printed drug product in August 2015, which is indicative of a new chapter for pharmaceutical manufacturing. This review article summarizes progress with 3D printed drug products and discusses process development for solid oral dosage forms.
